Natural language in computers

- Natural language is complex we must use approximations
- A model (e.g. an automaton, a grammar, a neural network) can be used for approximating language
- In, e.g., machine learning and natural language generation

Boy-girl AMRs

- From the boy-girl AMR corpus [Braune et al., 2014]
- Domain:
 - Concepts: boy, girl, want and believe
 - Relations: arg0 and arg1
- Requirements (for correct meanings):
 - boy and girl can only occur once each and are leaf nodes
 - There must be at least one occurrence of boy or girl
 - want and believe can have at most one each of arg0 and arg1 as outgoing edges
 - want and believe can only have arg1s as incoming edges

Contextual hyperedge replacement grammar

Discussion

Conclusion and future

Deference

Previous work

- Two graph grammar types were used for building boy-girl grammars [Jonsson, 2016]
 - Predictive top-down parsable grammars [Drewes et al., 2015]
 - Restricted directed acyclic graph grammars [Björklund et al., 2016]
- Both are hyperedge replacement grammars (HRGs)
 [Drewes et al., 1997] (but with restrictions)
- Both have polynomial-time parsing algorithms (which is not true for all HRGs)

Contextual hyperedge replacement grammar (CHRG)

Discussion

Conclusion and future work

Deference

Hyperedges and hypergraphs

- A hyperedge is an edge that can be connected to an arbitrary number of nodes; the sequence of connected nodes is called the attachment of a hyperedge
- A hyperedge attached to exactly two nodes is equivalent to an ordinary directed edge
- A *hypergraph* is a graph containing hyperedges

Question 1

Why does not hyperedge replacement seem to be powerful enough for the generation of minimal AMRs?

Intuitively, infinitely many nonterminals – and thereby rules – would be needed.

Thank you for listening!

Summary:

- AMRs are semantic representations of natural language sentences in the form of directed graphs
- Minimal AMRs do not have any repeated substructures
- We want to be able to check the correctness of AMRs
- Previously, hyperedge replacement was used, but minimal AMRs were not fully captured
- Here, contextual hyperedge replacement was used, and even the minimal AMRs could be generated
- Contextual rules cannot be used in practice since there is no efficient parsing algorithm for such grammars, but it is likely that there will be
