1

## Contents:

- ASTA - introduction
- Optimization of trading rules
- Predicting Ranks instead of Returns
- Time series prediction with ASTA

2

## Wanted:

- A test bench for old and new trading strategies
- An interactive development tool for trading rules
- An non-interactive development tool for trading rules
- Data generation for post processing

© Thomas Hellström 1999

3

## Two Formulations of the Prediction Task

### Methods with a fixed prediction horizon

- "The Time Series Approach"
- "The Trading Rule Approach"

#### Problem:

We don't necessarily intend to sell the stocks  $h$  days after we bought them

### Methods with no fixed prediction horizon

- Simulated trading with buy- and sell-rules

#### Problem:

Fewer points give lower statistical significance

© Thomas Hellström 1999

4

## The Trading Rule Approach:

$$T(t) = \begin{cases} \text{Buy} & : g(X(t)) > 0 \\ \text{Sell} & : g(X(t)) < 0 \\ \text{Do nothing} & : \text{otherwise} \end{cases}$$

$X(t) = (R_1(t), \dots, R_N(t))$

**X can be:** Past values of C,H,L,V or derived entities: Volatility, Trend, ...

#### Learning Task:

Find a function  $g$  that produces the best performance at a fixed prediction horizon OR when applying the trading rule  $T$

**Drawback:** Statistical significance;  
The Buy and Sell signals are  $\ll N$

© Thomas Hellström 1999

5

## Design Idea for an Artificial Trader

The trading algorithm is expressed as a Buy Rule and a Sell Rule:

#### Buy Rule :

$\text{Close}(T) > \text{Close}(T-1) \text{ & } \text{Volume}(T) > \text{mean}(\text{Volume}(T-10:T))$

#### Sell Rule :

$\text{Loss} > 10\% \mid \text{Profit} > 20\% \mid \text{Trend} < -2\%$

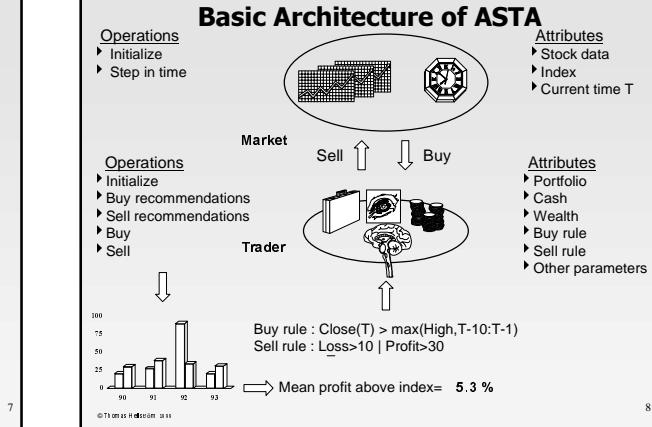

© Thomas Hellström 1999

6

## What Is Good Performance?

- Which performance measures are relevant
  - Total profit
  - Average profit per day
  - Profit per year
  - Number of trades
- What is the best way to measure the performance
- To what do we compare when we say it's good ?
  - Benchmarks: Official Stock Indexes

© Thomas Hildebrand 2011

11

## Performance of the Stochastics Indicator

12

## Predefined Functions in ASTA

### • Feature function:

- Close, High, Low, Volume, Rank, Trend, Volatility,...

### • Indicator functions:

- Stochastics, MACD, RSI, Keyrev, ClosePos, Runs, Days, Months, Daysin, Profit, Loss, Potential...

### • Operator functions:

- Min, Max, Mav, Crossings, Repeats,...

© Thomas Hertel 2001

13

## Using the Trader as an Objective Function

$p = \text{fast}(BuyRule, SellRule)$

### Example:

$p = \text{fast}('Trend5>0.5 \& Gvol5>1.5', 'Loss>10 \mid Profit>20')$

### Strategies:

#### • Parameterize the Buy Rule and Sell Rule:

- Buy Rule: 'Trend5>a & Gvol5>b'
- Sell Rule: 'Loss>c | Profit>d'
- Optimize P w.r.t. a, b, c and d

#### • The Buy Rule and Sell Rule are symbolic expressions

- Create new rules by combining functions and operators with genetic methods for example

© Thomas Hertel 2001

14

## The Stochastics Indicator

### Definition:

$$\text{Stoch}[K, Ks, D, BuyLevel, SellLevel](t) = (\text{Close}(t)-L) / (H-L)$$

### where

$$L = \text{mav}(\min(\text{Low}(t-K:t)), Ks)$$

$$H = \text{mav}(\max(\text{High}(t-K:t)), Ks)$$

### Decision rule:

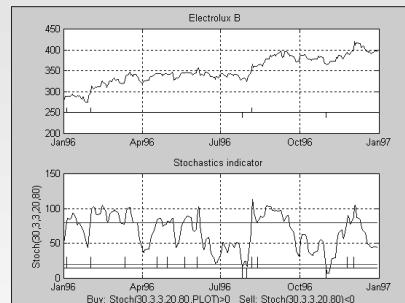

Buy if Stoch(t)>Buylevel

Sell if Stoch(t)<Selllevel

© Thomas Hertel 2001

15

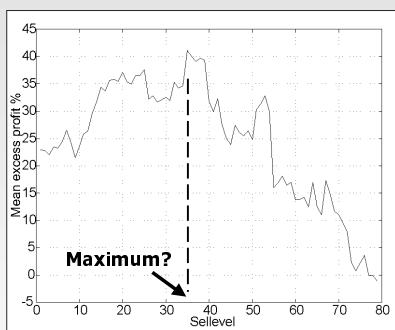

## The Stochastics Indicator

© Thomas Hertel 2001

16

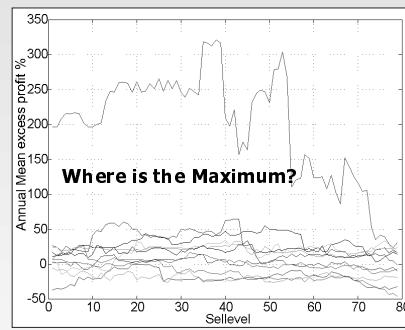

## P(Selllevel) for 11 Years

© Thomas Hertel 2001

17

## One Curve per Year

© Thomas Hertel 2001

18

## Risk

The function  $P(\theta)$  is stochastic and has no well-defined "maximum"

**Entities to maximize:**

• The mean value:  $E[P(\theta)]$

• The lower limit of a confidence interval:  
 $P_{\text{low}} = E[P(\theta)] - \sqrt{V[P(\theta)]}$

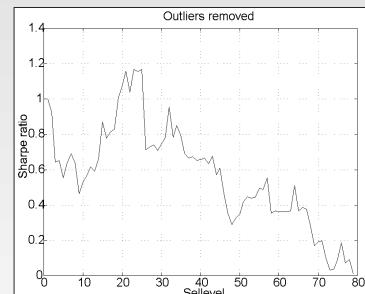

• The Sharpe Ratio:  $\frac{E[P(\theta)]}{\sqrt{V[P(\theta)]}}$

© Thomas Halden 2011

19

## Modified Sharpe Ratio:

$$\frac{E[P(\theta)]}{\sqrt{V[P(\theta)]}}$$

© Thomas Halden 2011

20

22

## Dow Jones University

TEST YOUR KNOWLEDGE

5. Chartists often interpret trading volume as indicating bearish or bullish conditions. When a market is falling in price and the volume of trading activity is decreasing, it usually signals which of the following?  
 A. Market strength (bullish)  
 B. Market weakness (bearish)  
 C. Can't tell

The correct answer is  
 A. Market strength (bullish)

A decline in volume often indicates that a trend is running out of steam. In this situation, in which prices are falling, a technical analyst could conclude that the decline in volume is a bullish sign because the downtrend may be ending. In our course, you'll learn to use technical analysis as a leading, directional indicator for individual stocks or whole markets.

24

## Buy in Downtrend combined with Decline in traded Volume

Better than index 9 out of 11 years.  
The mean excess profit 5.9% is however less than the standard deviation 8%

## Ranking Stock Returns R(t)

The k-day rank for stock m is defined as :

$$\text{Rank}_k^m(t) = \frac{\text{order } \{R_k^m(t), \{R_k^1(t), \dots, R_k^N(t)\}\} - 1}{N - 1} - 0.5$$

The stock with highest R gets rank 0.5  
The stock with lowest R gets rank -0.5  
The median stock gets Rank=0

Nice things about ranks:

- ✓ Predicting the rank is as good as predicting the returns
- ✓ Clear benchmark: hit rate for sign > 50%
- ✓ Uniform distribution
- ✓ The effect of global events gets automatically incorporated

26

## One-Day Memory in the Ranks

$\text{Rank}_1(t+1)$  tabulated as a function of  $\text{Rank}_1(t)$   
207 Swedish stocks 1987-1997

Rank<sub>1</sub>(t)

Rank(t+1)	-0.45	-0.35	-0.35	-0.15	-0.05	0.05	0.15	0.25	0.35	0.45
Fraction% > 0	59.4	52.9	49.1	47.3	48	49.6	49.5	48.2	47.8	46.4
Mean rank	0.067	0.017	-0.005	-0.011	-0.011	-0.004	-0.005	-0.01	-0.014	-0.033
no. of obs.	30878	30866	31685	30837	30434	31009	31258	30539	30951	31550

With 59.4% probability:

- ✓ The worst performing 10% of the stocks will be in the upper half next day.
- ✓ This prediction can be done EVERY day (since there is always a worst performing 10%).

30

## How About Predicting Ranks?

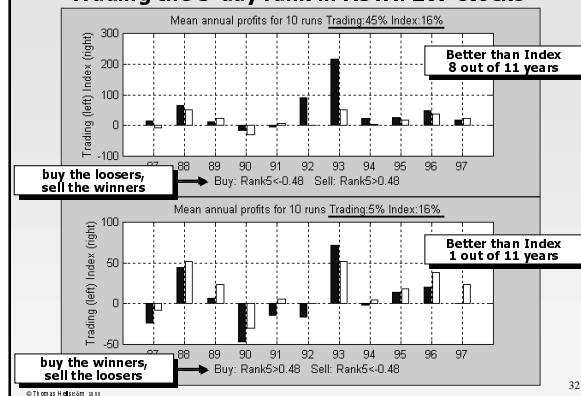

Ideas:

- ✓ Use the rank variables as inputs and/or outputs in a time series prediction. E.g:  
 $\text{Rank}_1(t+1) = g(\text{Rank}_1(t), \text{Rank}_1(t-1), \dots, \text{Rank}_1(t-k))$   
 or  
 $\text{Rank}_1(t+1) = g(R_1(t), R_5(t), \dots, R_k(t))$
- the function g may be a neural network, fuzzy rule base etc.
- ✓ Formulate Trading rules based on rank variables. E.g:  
 Buy if  $\text{Rank}_1(t) < -0.40$  AND  $\text{Rank}_5(t) < 0.3$

© Thomas H. Holden 2011

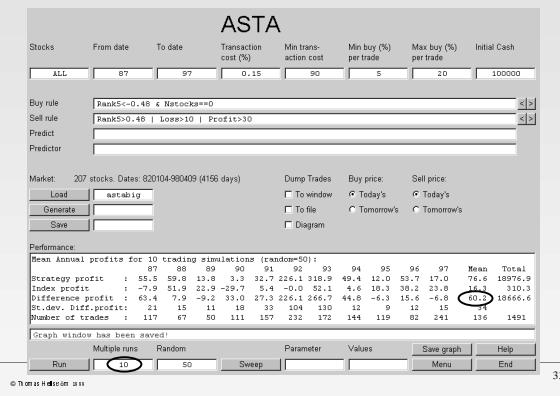

31

## Trading the 5-day rank in ASTA. 207 stocks

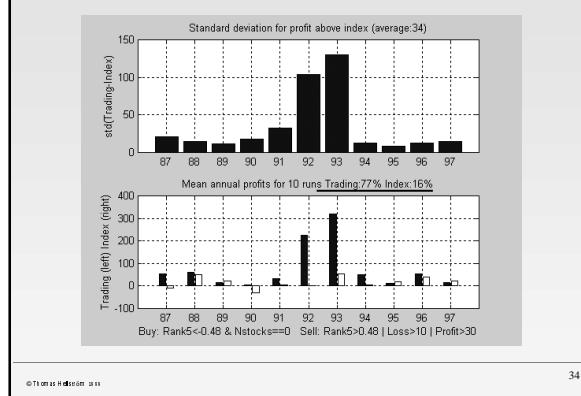

32

## Refined trading rules with 5-day rank.

© Thomas H. Holden 2011

## Refined trading rules with 5-day rank.

34

## The Time Series Approach

Find a function g:

$$g(y(t), y(t-1), \dots, y(t-k)) \approx y(t+h)$$

where y is the returns for the stock prices

Minimize the RMSE:

$$P_h(t) = \sqrt{\frac{1}{N} \sum_{t=1}^N (g(t) - y(t+h))^2}$$

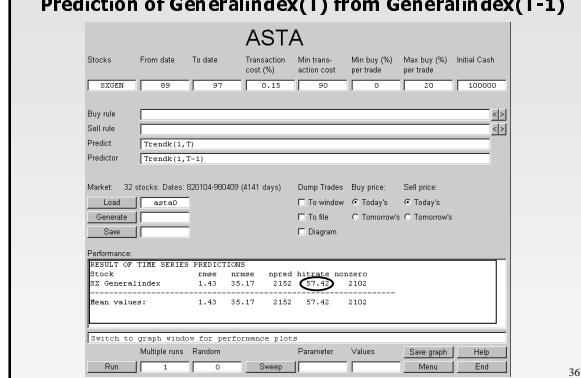

OR Maximize the hit rate for the sign predictions:

$$H = \frac{|\{t | y(t)g(t) > 0, t = 1, N\}|}{|\{t | y(t)g(t) \neq 0, t = 1, N\}|}$$

© Thomas H. Holden 2011

**Using ASTA Non-Interactively for Time Series Predictions**

A matlab function returns the performance:  
 $p = \text{tasta}(\text{predict}, \text{predictor})$

**Example:**

```
> tasta('Trendk(1,T+1)', 'Trendk(1,T)', [87 97], 'SXGEN')
> 57.42
```

**Covariance Analysis of 1-Day-Returns for 6 Indexes**

Dates: 890102-971229 approx. 2000 data points

	DJ	SP500	Nikkei50	DAX	SXGEN	FTSE100
DJ	50.53	51.03	53.94	58.78	58.74	55.00
SP500	53.66	51.27	55.26	60.74	58.83	56.69
Nikkei50	54.04	53.85	50.15	50.41	51.77	49.01
DAX	49.62	49.90	51.67	50.58	52.41	49.63
SXGEN	50.46	51.45	53.14	53.86	57.40	49.85
FTSE100	49.95	51.49	53.92	54.07	54.10	50.10
Naive	55.03	54.78	49.30	53.54	52.48	52.91

Selection: 1-day-return > 0.5 approx. 500 points left after selection

	DJ	SP500	Nikkei50	DAX	SXGEN	FTSE100
DJ	56.71	55.47	58.45	69.58	70.85	65.94
SP500	61.40	56.74	57.08	73.76	69.90	68.69
Nikkei50	60.07	59.40	48.82	53.14	52.61	50.17
DAX	51.55	52.17	52.40	53.75	53.54	51.13
SXGEN	56.30	55.74	53.67	58.40	62.78	53.52
FTSE100	55.23	55.81	56.39	61.23	59.75	54.72
Naive	55.03	54.78	49.30	53.54	52.48	52.91

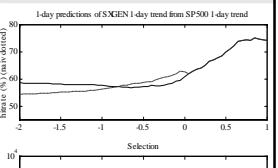

E.g.: The sign of a return at time T for Dow Jones is in 58.74% of the cases the same as the sign of the return for SXGEN at time T-1. Selecting only those cases where the return for Dow Jones > 0.5/day causes this figure to increase to 70.85%. 40

**ASTA**  
 Artificial Stock Trading Agent

- ASTA is written in MATLAB
- To use ASTA you must have a MATLAB system running on your machine
- The ASTA system will soon be available for download and is free for private and academic use
- More information on <http://www.cs.umu.se/~thomash/asta/home>
